

Virtual Networking. A value-adding module in T-VPN.

Virtual Networking integrates all telephone lines of your company into a uniform numbering scheme.

How transparent and flexible is your telecommunications infrastructure?

Can new locations be incorporated rapidly into the voice communications system?
Can existing telecommunications equipment (TC systems) be integrated into a common solution? Does your solution support the formulation of company structures on a company-wide telephone number scheme?
Virtual Networking in T-VPN brings transparency to company communications.

Services and function.

Virtual Networking in T-VPN provides all functions for the rapid and flexible integration of all voice communications resources of your company in a uniform solution. It connects the lines and TC systems of your company to an intelligent voice network operated within the Deutsche Telekom network – regardless of whether they are fixed-network or mobile lines, telephone systems or central exchanges. With Virtual Networking, the same features are available for every line throughout the company. Every line can be reached via its abbreviated number – also from outside, using central dial-in numbers. A uniform telephone number scheme that applies throughout the solution guarantees optimal reachability from everywhere in the company and facilitates the assignment of a number to departments or locations. This also enables you to formulate cross-location business units with the greatest possible transparency, for example. Likewise, it is possible to assign a „lifetime“ telephone number to each employee, i.e. one that remains valid independent of location and office.

The advantages.

Virtual Networking provides for the absolutely smooth, rapid and flexible installation and expansion of your voice communications network. Whether mobile employees or new locations – they can all be integrated transparently into the internal voice communications system immediately – without expensive fixed lines.

Virtual Networking provides flexibility when facing new challenges such as restructuring, reorganisations and relocations. In so doing, it effectively supports the optimisation of established business processes and facilitates the implementation of new ones. And the direct cost benefits of Virtual Networking represent a persuasive argument, too, as it renders additional TC systems superfluous. Along with eliminating the need for additional investment, this results in a considerable reduction in administration and maintenance costs.

The facts:

Virtual Networking in T-VPN

- Integration of any number of fixed-network and mobile lines as well as TC systems
- Rapid implementation, flexible installation and expansion
- Uniform TC system functionality at all lines
- Telephone number scheme and harmonised dial-in throughout the company
- Lifetime personal“ telephone number
- Cost reduction through elimination of fixed lines, TC systems, administration and maintenance

What is T-VPN?

T-VPN is a voice solution from T-Systems that connects lines from any number of locations to a virtual private voice network. Optional value-adding modules can be used to expand any T-VPN solution, incorporating intelligent functions to optimize your business processes.
